

Hand this to the person who has to explain the GitHub Actions bill. The invoice is a lump sum. Write the org and the week, copy the rounded minutes off the paste or the screenshot, and name what to cut. This page does not name the workflow.

ORG

WEEK OF

PREPARED FOR

How to read the paste or the screenshot

12 seconds still bills 1 minute. GitHub rounds each started job up to the next whole minute. A 12-second job is 1 billed minute. Adding up the seconds and then rounding is not how this bill works. The usage report already shows those rounded minutes.

A billing screenshot is a picture. Write the minutes you can see. This memo does not read pixels.

OS multipliers

Included minutes on standard hosted runners, per rounded minute:

Linux 1× • Windows 2× • macOS 10×

One macOS minute burns 10 included minutes. Larger runners cannot use included minutes. List \$ per rounded minute: Linux \$0.0060 • Windows \$0.0100 • macOS \$0.0620.

Minutes from the paste or screenshot

OS	ROUNDED MIN	MULTIPLIER	INCLUDED-MINUTE BURN	EST. \$ (LIST)
Linux		1×		\$
Windows		2×		\$
macOS		10×		\$
Total				\$

☐ Pasted usage report ☐ Billing screenshot (numbers typed from what you can see)

Est. \$ = rounded minutes × list rate. Label it an estimate. Public repos, self-hosted runners, and larger-runner SKUs are outside this sheet. Source: GitHub Actions runner pricing, 2026-09-05.

What to cut

1

2

3

Name the OS, the habit, or the matrix — macOS minutes, a wide Windows matrix, jobs that start and finish in seconds. This sheet does not name the workflow.
